Airec becomes a key partner for CO₂-free electricity generation in Australia

Airec AB has signed a cooperation agreement with the Australian company CoGen Power (CoGen) for the selling and marketing of the AirCross and AirCompact heat exchangers. CoGen is a newly started company focused in waste heat recovery for electricity production and the high performance of the Airec heat exchangers is vital for the technical viability of the system.

CoGen has been started to design and commission waste heat-to-electricity systems for mine power supply in Western Australia. CoGen's aim is to recover over 1500MW waste heat via Airec products in the next 5 years to generate CO₂ free electricity.

"After a world-wide survey we have chosen Airec as our exhaust gas heat exchanger partner. Their efficiency and compactness is much better compared to existing traditional designs", says CoGen president Ross Smith.

The first system is due to be installed by September 2009 in West Australia, at the Jaguar Base Metal mine site owned by the company Jabiru Metal Ltd's. More detailed information about this pioneering project can be found in our case studies section.
